SUMMARY

The United States Environmental Protection Agency (EPA) tasked the Weston Solutions, Inc. (WESTON) Superfund Technical Assessment and Response Team (START) to assist the EPA in conducting a Phase II Environmental Site Assessment (ESA) for the Acme Power Plant at 165 Acme Road located in Sheridan, Wyoming (WY) (Site) (Figure 1). This Phase II ESA report documents activities and results related to the hazardous building material portion of the overall Phase II ESA investigation. Activities and results regarding other media investigated during the Phase II ESA (e.g., drilling, sub-surface soils, groundwater, etc.) is presented in a separate report (WESTON, 2017c).

SCOPE OF WORK

This Phase II ESA was conducted in accordance with Technical Direction Document (TDD) 0003/1609-07 and ASTM, International (ASTM) E1903-11– Standard Practice for Environmental Site Assessments: Phase II Environmental Site Assessment Process. The purpose of a Phase II ESA is to achieve the objectives set forth in the Statement of Objectives (SOO) developed by the EPA, user(s), and the Phase II Assessor. Goals for this Phase II ESA were to acquire and evaluate sufficient information to determine the location and concentration of potential environmental contamination at the Site, if present. The specific SOO for this Phase II ESA were as follows:

- Assess and evaluate suspected contaminants that may be present at the Site. Develop sufficient information to reasonably render a professional opinion that, with respect to the potential concerns assessed, hazardous substances either are or are not present at the property, including the concentrations of the substances if present;
- Gather and provide sufficient data to assist the Targeted Brownfield Assessment (TBA) recipient to make informed decisions with regard to the future use of the property; and
- Gather sufficient data to provide cost estimates for properly disposing of hazardous materials, remediation, and or demolition, if necessary.

SITE BACKGROUND

The property was previously owned by Diversified Resources LLC, which is listed as an "Inactive-Administratively Dissolved" entity. The Sheridan County Conservation District (SCCD) assumed ownership in June 2017 after completion of a Phase I ESA by START (WESTON, 2017a). The former Acme Power Plant was a coal-fired power plant that supplied power to the Acme Mine and surrounding area. The power plant was constructed in 1910, with additions to the plant in 1947 and 1953. After the power plant ceased operation sometime in the late-1960s to early-1970s, the Site was used for other commercial operations, including but not limited to, car crushing and battery recycling activities. However, these activities were not conducted as registered businesses. The Site is currently abandoned and not being utilized for commercial or industrial purposes.

Sheridan County Conservation District (SCCD) is interested in cleaning up any contamination present as part of water quality improvement efforts in the Tongue River Watershed and potentially for future recreational use of the location. The Phase I ESA completed by START (WESTON, 2017a) identified the possibility of asbestos-containing material (ACM), lead-based paint (LBP), and other environmental hazards being present, due to the age of the buildings. The Phase II ESA was performed as a result of the findings of the Phase I ESA.

SUMMARY OF RESULTS AND CONCLUSIONS

Phase II assessment fieldwork was conducted between May 31st and June 4th, 2017. Results of the Phase II ESA have confirmed the presence of contaminants of concern (COCs) at the Site. The following is a summary of the hazardous building material results and conclusions regarding COCs and associated media identified by START at the Site.

Asbestos-Containing Material (ACM)

Five buildings at the Site were assessed for ACM: Power Plant, Shop, Little House, Trailer, and Barn. In addition, exterior surface soil samples were collected to aid in determining if asbestos fibers sourced from Site debris or if ACM from within the Power Plant has migrated. Of the 111 samples submitted for laboratory analysis, a total of 75 samples were determined to be "positive" (>1% asbestos) for asbestos. The following tables indicate the locations and estimated extents of ACM identified at the Site per building or media. See Sections 5.1 and 6.1 of this report for a more detailed breakdown.

Power Plant			
ACM Material	Estimated Extent	Location	
Boiler Insulation	150 sq. ft.	Detroit Stoker	
Brick Caulk	50 LF	Heine Boiler	
Brick Plaster	1,000 sq. ft.	Heine Boiler	
Door Insulation	5 sq. ft.	Steam Boiler Unit	
Electrical Panel	1 panel	South Turbine Room	
Equipment Jackets	4,330 sq. ft.	Throughout Building	
Fiberboard	1,500 sq. ft.	South Rooms	
Fire Brick	10 sq. ft.	2 nd Level Catwalk	
Fire Doors	3 Doors	South Rooms	
Furnace Bricks and Cement	6,000 sq. ft.	Boilers	
Insulation Debris	1,380 cu. ft.	Throughout Building	
Pipe Flange Gaskets	200 Gaskets	Throughout Building	
Pipe Insulation	1,420 LF	Throughout Building	

0003/1609-07

Power Plant			
ACM Material	Estimated Extent	Location	
Pipe Joints	356 Joints	Throughout Building	
Plaster ¹	5,850 sq. ft.	Main Turbine Rooms	
Roofing Material – Silver Coating	13,500 sq. ft.	Roof	
Wire Insulation	50 LF	5 th Level Catwalk	

Notes:

 1 = insulation debris attached to the plaster was found to be ACM

cu. ft. = cubic feet

LF = linear feet

sq. ft. = square feet

Barn		
ACM Material	Estimated Extent	Location
Fiberboard	80 sq. ft.	Loft
Manhole Gasket	14 rolls	Main Level
Pipe Insulation	2 boxes	Main Level and Loft

Notes:

sq. ft. = square feet

Shop		
ACM Material	Estimated Extent	Location
Asbestoline and Fireite	2 gallons	Loft
Brake Pad	3 pads	Main Level
Covering	5 LF	Main Level
Packing/Gasket	8 rolls and 3 gaskets	Main Level
Roofing Material - Tar	110 LF	Roof

Notes:

LF = linear feet

Little House		
ACM Material	Estimated Extent	Location
Linoleum	80 sq. ft.	Main Level

Notes:

sq. ft. = square feet

Exterior Soils		
Sample ID	Asbestos Type (% Composition)	Location
APP-SO01-ACM	Chrysotile (Trace)	Beneath pipe insulation debris tote
APP-SO02-ACM	Chrysotile (Trace)	Northwest door

0003/1609-07

Exterior Soils		
Sample ID	Asbestos Type (% Composition)	Location
APP-SO03-ACM	Chrysotile (Trace)	Southeast door
APP-SO04-ACM	Chrysotile (Trace)	Northeast door

Based on the results of the ACM survey, asbestos is present throughout the Power Plant as well as in the Barn, Shop, and Little House. The presence of trace amounts of asbestos in exterior surface soils located outside the door of the Power Plant indicates friable asbestos fibers are migrating beyond the walls of the Power Plant building. ACM is considered to be a COC in relation to the Site.

Lead-Based Paint (LBP)

Five buildings at the Site were assessed for LBP: Power Plant, Shop, Little House, Trailer, and Barn. Of the 96 X-ray fluorescence (XRF) readings collected, a total of 31 readings were determined to be "positive" (>1 milligrams per square centimeter [mg/cm²]) for lead. The following tables indicate the locations and estimated extents of LBP identified at the Site per building. See Sections 5.2 and 6.2 of this report for a more detailed breakdown.

Power Plant		
Location	Current Surface Paint Color	Estimated Extent
Exterior		
Door	Green	170 sq. ft.
Door Frame	Green	100 LF
Window Sash	Green	2,350 LF
Interior		
	Brown	50 sq. ft.
Door	Dark Brown	100 sq. ft.
	Green	25 sq. ft.
	White	25 sq. ft.
Wall	Cream	1,200 sq. ft.
	Dark Brown	650 sq. ft.
	White	3,000 sq. ft.
Window Frame	White	1,000 LF

Notes:

LF = linear feet

sq. ft. = square feet

Barn		
Location	Current Surface Paint Color	Estimated Extent
Exterior		
Door	Green	150 sq. ft.
Door Jamb	Green	30 LF
Interior		
Door	Green	230 sq. ft.

Notes:

LF = linear feet

sq. ft. = square feet

Shop		
Location	Current Surface Paint Color	Estimated Extent
Exterior		
Door	Green	150 sq. ft.
Trim	Green	60 LF
Window Sash	Green	720 LF
Interior		
Door	Green	230 sq. ft.

Notes:

LF = linear feet

sq. ft. = square feet

Trailer		
LocationCurrent Surface Paint ColorEstimated Extent		Estimated Extent
Exterior		
Wall	Dark Brown	60 sq. ft.

Notes:

sq. ft. = square feet

Little House		
Location	Current Surface Paint Color	Estimated Extent
Exterior		
Wall	White	150 sq. ft.
Notes:	•	

sq. ft. = square feet

Based on the XRF results, elevated lead concentrations are present on door components, window components, walls, and/or trim in all five buildings at the Site. The preceding tables list the location, current surface paint color, and estimated extent of LBP present at the Site. Although there were positive readings on building exterior surfaces, no bare soils were present around the locations of the readings. Therefore, lead impacts to surface soil were not evaluated. LBP is considered to be a COC at the Site.

Polychlorinated biphenyls (PCBs), Mercury, and Mold

Visual inspections were conducted to identify possible polychlorinated biphenyl (PCB)-containing equipment, mercury-containing equipment, and mold. A summary of the observations regarding the visual inspections conducted are presented below:

- Of the light ballasts observed, potential PCB-containing ballasts were only identified in the Barn and Maintenance Shop. None of the light fixtures observed in the buildings appeared to be leaking fluids. Additionally, five transformers which are currently or have previously leaked in the past, are believed to have PCBs present as indicated in building sediment sample results (WESTON, 2017c). PCBs are also assumed to be present in lubrication oils and grease of the coal delivery system, compressed air lines, boilers, ash handling systems, and switch gears (GEI, 2000). PCBs are considered COCs in relation to the Site.
- One mercury thermostat switch was observed in the Trailer at the Site. Mercury is considered a COC in relation to the Site.
- Mold was encountered throughout the Power Plant and in the Barn at the Site. Mold is considered a COC in relation to the Site.

SUMMARY OF RECOMMENDATIONS

Based on the results of the environmental assessment, START recommends the following:

 START recommends consulting with the Wyoming Department of Environmental Quality (WDEQ) Air Quality Division (AQD) Asbestos Program regarding the path forward for cleanup of ACM at the Site. Due to the extensive amount of asbestos identified, the remedial option selected for ACM will likely be the primary driver for remediation of all hazardous building materials identified at the Site. Possible remediation options for discussion may include constructing an asbestos landfill on-site or abatement and off-site disposal. Regardless, START recommends contracting an accredited asbestos remediation company to help determine and/or implement appropriate remedial actions to address the ACM at the Site during the cleanup phase of redevelopment. Any work conducted should be performed by companies certified to handle ACM materials.

- Remove and properly dispose of the tote of friable pipe insulation debris located on the southwest portion of the property next to the railroad tracks. Additional assessment of exterior surface soils using an Incremental Sampling Methodology will be needed to delineate the extent and depth of the asbestos impacts. Activity based sampling is recommended for exposure assessments (WDEQ, 2014).
- START recommends contracting an accredited lead remediation company to determine appropriate remedial actions and/or disposal requirements to address the LBP at the Site during the cleanup phase of redevelopment (e.g., encapsulation, chemical striping, removal, etc.). Additional paint chip samples may be collected to confirm LBP. Dust control methods should be implemented for the debris and it is recommended that all work be performed by an EPA Lead-Safe certified firm. Toxicity Characteristic Leaching Procedure (TCLP) samples will be required for on-site or off-site disposal as per the WDEQ Solid and Hazardous Waste Division requirements (WDEQ, 2015).
- PCB-containing equipment identified or encountered should be properly removed and disposed prior to renovation or demolition activities. Additional sampling of equipment and concrete in the basement of the Power Plant, especially below the transformers, may be necessary prior to on-site or off-site disposal in order to comply with the Toxic Substance Control Act.
- All mercury-containing thermostat switches identified or encountered should be properly removed and disposed prior to renovation or demolition activities.
- Mold should be controlled during demolition (e.g., dust control, ventilation, etc.) or remediated by a certified restoration company, as necessary pending the remediation options selected for the Site.
- As a safety precaution, do not enter the Power Plant or Barn without developing a sitespecific health and safety plan. Affix warning signs as described in 29 CFR 1910.1001 to all entrances of buildings with asbestos present.

This summary is intended to be a general description of the scope of work, results, conclusions, and recommendations identified as a result of the Phase II ESA of the Site; however, this section is not intended to be a "stand alone" document or to include the basis of all conclusions presented. The report should be read and used in its entirety. Information included in this section is subject to the scope of services and limitations noted in the original TDD and in this complete report.

1.0 INTRODUCTION

1.1 SCOPE OF WORK AND PURPOSE

The Weston Solutions, Inc. (WESTON) Superfund Technical Assessment and Response Team (START) conducted a Phase II Environmental Site Assessment (ESA) for the Acme Power Plant located at 165 Acme Road, Sheridan, Wyoming (WY) (Site) (Figure 1). The ESA was conducted in accordance with Technical Direction Document (TDD) 0003/1609-07 and ASTM, International (ASTM) E1903-11 – Standard Practice for Environmental Site Assessments: Phase II Environmental Site Assessment Process. The purpose of a Phase II ESA is to acquire and evaluate information sufficient to achieve the objectives set forth in the Statement of Objectives (SOO) developed by the user(s) and the Phase II Assessor. The scope of a Phase II ESA is related to the activities agreed upon to meet the objectives of the investigation as defined in the SOO which are subject to ongoing evaluation and refinement as the assessment progresses. The SOO developed for this Site is presented in Section 1.2.

This Phase II ESA report contains the results of the data collection activities and associated quality assurance (QA)/quality control (QC) measures conducted related to the hazardous building material portion of the overall Phase II ESA investigation at the Site. Activities and results regarding other media investigated during the Phase II ESA (e.g., drilling, sub-surface soils, groundwater, etc.) are presented in a separate report (WESTON, 2017c). Information used to conduct this Phase II ESA was based upon reasonably ascertainable, visually and physically observable conditions, and included testing or sampling of materials. The structure of this report is based on the ASTM E1903-11 standard.

1.2 STATEMENT OF OBJECTIVES

The objectives were developed by the Sheridan County Conservation District (SCCD) (user), START (Phase II Assessor), and the United States Environmental Protection Agency (EPA) to obtain sound, scientifically valid data concerning actual property conditions at the Site with respect to the presence or the likely presence of target analytes/substances including, but not limited to, those within the scope of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). The SOO for the Site were determined during the project scoping meetings held on November 14th, 2016 and January 12th, 2017. The Phase II ESA objectives determined for the Site were as follows:

- Assess and evaluate suspected contaminants that may be present at the Site. Develop sufficient information to reasonably render a professional opinion that, with respect to the potential concerns assessed, hazardous substances either are or are not present at the property, including the concentrations of the substances if present;
- Gather and provide sufficient data to assist the Targeted Brownfield Assessment (TBA) recipient to make informed decisions with regard to the future use of the property; and
- Gather sufficient data to provide cost estimates for properly disposing hazardous materials, if necessary.

2.0 SUMMARY OF BACKGROUND INFORMATION

Sheridan County Conservation District (SCCD) is interested in cleaning up any contamination present as part of water quality improvement efforts for the Tongue River Watershed and potentially for future recreational use of the location. Prior to redevelopment, stakeholders would like to determine the location and extent of contaminants before moving forward.

2.1 PROPERTY DESCRIPTION, LOCATION, AND HISTORY

The Site is approximately 5.8 acres located on the south bank of the Tongue River, approximately 0.4 miles west of the confluence of the Tongue River and Goose Creek. The property was previously owned by Diversified Resources LLC, which is listed as an "Inactive-Administratively Dissolved" entity. The Sheridan County Conservation District (SCCD) assumed ownership in June 2017 after completion of a Phase I ESA by START (WESTON, 2017a). The former Acme Power Plant was a coal-fired power plant that supplied power to the Acme Mine and surrounding area. The power plant was constructed in 1910, with additions to the plant in 1947 and 1953. After the power plant ceased operation sometime in the late-1960s to early-1970s, the Site was used for other commercial operations, including but not limited to, car crushing and battery recycling activities. However, these activities were not conducted as registered businesses. The Site is currently abandoned and not being utilized for commercial or industrial purposes. There are currently five buildings at the Site (Figure 2), as described below:

- <u>Power Plant</u>: Five-story industrial building, with a basement, grated steel catwalks, a footprint of approximately 13,100 sq. ft., and several pieces of equipment still present.
- <u>Barn</u>: One-story barn structure, with a footprint of approximately 2,200 sq. ft., and a loft for storage.
- <u>Shop</u>: One-story maintenance building, with a footprint of approximately 1,300 sq. ft., and a loft for storage.
- <u>Trailer</u>: One-story building, with a crawlspace, a footprint of approximately 1,150 sq. ft., and consisting of two mobile homes joined into one.
- <u>Little House</u>: One-story building, with a footprint of approximately 85 sq. ft., and consisting of a single room.

The Phase I ESA performed by START (WESTON, 2017a), highlighted the possibility of asbestos-containing material (ACM), lead-based paint (LBP), and other environmental hazards being present, due to the age of the buildings. This Phase II ESA was performed as a result of the conclusions of the Phase I ESA.

2.2 PREVIOUS ENVIRONMENTAL REPORTS AND RECORDS

Previous environmental reports and/or records, if available, were obtained by START from various sources, including local agencies, and reviewed for information relating to the Site. A summary of records obtained is provided in the following table.

Document Reviewed	Description
Document: TBA Application Prepared for: EPA Prepared by: SCCD Date: 2016 Report Source: EPA	 Document Summary: The application gives brief summaries of site background information and environmental conditions at the subject property (including potential contaminants). The application also provides contact names(s) and phone numbers for stakeholders, and potential redevelopment plans. Information Relating to the Subject Property: The property was historically utilized as a coal-fired power plant for the Acme Mine between 1910 and 1964. Following the closure of the plant, the property was repurposed for other various commercial operations, including car crushing, salvage operations, and battery recycling activities before being abandoned. SCCD was interested in acquiring the property and cleaning it up as part of water quality improvement efforts for the Tongue River Watershed. The intent is to clean up the site so that it can be used for recreational purposes including access to the Tongue River, picnicking, bird watching, hiking, etc. Although exact redevelopment plans are unknown, the subject property is an ideal area for recreational and green space uses.
Document: Phase I ESA (WESTON, 2017a) Prepared for: EPA Prepared by: WESTON Date: 2017 Report Source: WESTON	 Document Summary: This Phase I ESA revealed the following recognized environmental conditions: existing stained surface soil and stressed vegetation, drum storage areas, previous undocumented activities, transformer spill of PCB-containing oil, coal ash pile, and historic coal-fired power plant operations. Non-scope considerations identified include: observed mold growth and ACM, LBP, mercury-containing equipment, and PCB-containing equipment due to the age of the buildings. Information Relating to the Subject Property: Historically the property was used as a coal-fired electric power plant from 1910 to 1964 and later for various commercial operations including car crushing and auto salvage operations, and battery recycling activities. Additions to the power plant were completed in 1947 and 1953. The Tongue River runs through the northern side of the property, which contains one large brick building, a brick storage warehouse, a metal garage, a modular trailer and several mobile trailers. There is also a large amount of various types of debris on the property. On the north edge of the property and on the north bank of the Tongue River lies a portion of the power plant's associated coal ash pile.

3.0 DESCRIPTION OF WORK PERFORMED AND RATIONALE

This section summarizes the work performed and rationale for the work conducted to meet the SOO developed for the investigation as documented in the approved Sampling and Analysis Plan (SAP) for the Site (WESTON, 2017b). Deviations from the approved SAP for this Phase II ESA are presented in Section 3.4.

Based upon the SOO developed for the Site, ACM and LBP surveys were conducted on the five buildings at the Site along with visual inspections for polychlorinated biphenyl (PCB)-containing equipment (e.g., fluorescent light ballasts, transformers, etc.), mercury-containing equipment (e.g., thermostat switches), and mold as part of this Phase II ESA. The investigation included visual inspection, field screening, and/or sample collection for laboratory analysis. Details of the individual media investigations along with rationale are presented below. Photographs of field activities are presented in the Photograph Log (Appendix A). The Phase II fieldwork was conducted between May 31st and June 4th, 2017.

3.1 ASBESTOS-CONTAINING MATERIAL

This Phase II ESA involved an ACM survey, including the collection of bulk asbestos samples and soil samples, in order to establish the extent and presence of ACM. The survey was conducted by Asbestos Hazard Emergency Response Act (AHERA) certified asbestos building inspectors: Mr. Michael Cherny and Mr. Joe Rudi. Visual inspections were conducted on areas of the structures where an individual performing demolition or renovation operations may encounter regulated asbestos-containing material (RACM). Sample locations and the total number of samples were based on AHERA standards (EPA, 1985) and/or the best professional judgment of the inspector. Each potential RACM location was touched to determine if it was friable. Bulk samples were collected of all suspect friable and non-friable RACM and submitted to an asbestos-certified laboratory for analysis. Discrete exterior surface soil samples were collected in areas adjacent to doors and suspect material debris piles.

3.2 LEAD-BASED PAINT

Due to the age of the buildings at the Site, this Phase II ESA involved a LBP survey by EPA Certified LBP Inspector: Mr. Michael Cherny. In order to conduct the LBP survey, an X-ray fluorescence (XRF) instrument was used on painted surface locations to determine if materials were positive for lead (≥ 1 milligram per square centimeter [mg/cm²]). Visual inspections were conducted on areas of the buildings and XRF readings were collected based upon the best professional judgment of the inspector.

3.3 VISUAL INSPECTIONS

Visual inspections were conducted for potential PCB-containing equipment, mercury-containing equipment, and mold. The visual inspections were conducted in order to make a presence/non-presence determination of the hazards. Quantity and location information was documented where possible, but no samples were collected.

3.4 DEVIATIONS FROM THE SAMPLING AND ANALYSIS PLAN

Due to the ongoing evaluation and refinement of the SOO, changes can occur to the approved SAP based upon site conditions encountered. A list of the deviations from the approved SAP are presented below.

- Sample nomenclature was modified to include a building identifier letter:
 - "P" for Power Plant,
 - "B" for Barn,
 - "M" for Maintenance Shop,
 - "H" for Little House, and
 - "T" for Trailer).

No other deviations from the approved SAP were identified during this Phase II ESA.

4.0 DESCRIPTION OF METHODS USED

4.1 ASBESTOS-CONTAINING MATERIAL

Asbestos Bulk Sampling

Personnel performing the sampling wore personal protective equipment (PPE) appropriate to the hazard(s) presented and included gloves, Tyvek, booties, hard hats, and/or high-efficiency particulate air (HEPA) respiratory protection. Asbestos bulk samples were randomly collected using the grid system described in the EPA publication "Asbestos in Buildings – Simplified Sampling Scheme for Friable Surfacing Materials" (EPA, 1985). The following general sampling guidelines were followed during the inspection, as applicable:

- In areas where homogeneous suspected RACM (surfacing) was less than 1,000 square feet (sq. ft.), three randomly collected bulk samples were collected from each area;
- In areas where homogeneous suspected RACM (surfacing) was at least 1,000 sq. ft., but less than 5,000 sq. ft., five randomly collected bulk samples were collected from each area;
- In areas where homogeneous suspect RACM (surfacing) was at least 5,000 sq. ft., seven randomly selected bulk samples were collected from each area;
- At least three samples were collected from thermal systems insulations (TSI);
- At least one sample was taken from pipe fittings; and
- For miscellaneous materials, a minimum of one bulk sample was collected for each type.

Quality Assurance (QA)/Quality Control (QC)

Side-by-side field duplicate samples were collected at the frequency of one per 20 bulk samples. A brown fibrous debris layer (reported at 40% asbestos) was noted by the lab in sample APP-P-PL01-040, but was not reported as a layer in the duplicate sample APP-P-PL01-110. This additional layer is thought to be general debris present in the sampling area and not representative of the plaster itself. No other discrepancies were reported in the laboratory results and all results are considered acceptable.

Laboratory Analytical Methods

Samples collected were sent to Reservoirs Environmental Inc. in Denver, Colorado (CO) for polarized light microscopy (PLM) analysis by Method EPA 600/R-93/116 to determine a visual estimation of asbestos content and, if applicable, Method EPA 600/R-93/116 (400 Point Count).

4.2 LEAD-BASED PAINT

XRF Readings

XRF in-situ readings were collected using an Innov-X Alpha Series[™] handheld XRF instrument to analyze painted and coated surfaces (interior and exterior) for lead during this Phase II ESA.

XRF readings of walls, windows, and other painted surfaces in each room equivalent were collected. Room equivalents include painted or coated surfaces that are not considered to be separate rooms such as hallways and closets. A representative number of sample readings were collected from a subset of rooms considered by the certified LBP inspector to be of like coated surfaces.

In general, locations where the paint appeared to be thickest were selected for XRF analysis. Locations where paint was worn away or scraped off were avoided. Areas over pipes, electrical surfaces, nails, and other possible interferences were also avoided. The XRF probe faceplate was allowed to lie flat against the surface of the test location to obtain a quality reading.

QA/QC

The following QA/QC activities were conducted as part of this investigation:

• <u>XRF Standardization Readings</u> – XRF standardization readings were collected prior to use, every four hours during use (as applicable), and following use to verify accuracy.

No other QA/QC activities or sample types were required based upon the assessment techniques and sample collection methods. Based on the results of the standardization readings, all results reported are considered acceptable. Results of the QA/QC readings are presented in Table 5.

Laboratory Analytical Methods

Due to no inconclusive readings reported by the XRF instrument, no paint chip samples were collected for laboratory analysis.

4.3 PCBS, MERCURY, AND MOLD

Visual Inspections

Visual inspections were conducted for presence/non-presence determination for possible PCBcontaining equipment, mercury thermostat switches, and mold. Suspect hazards encountered, if any, were documented in field notes and/or photographed.

5.0 PRESENTATION OF INFORMATION AND DATA ACQUIRED

5.1 ASBESTOS-CONTAINING MATERIAL

5.1.1 Power Plant

A total of 79 bulk samples were collected from the Power Plant building and submitted for PLM analysis. The following number of samples were collected of each bulk material.

Bulk Material	Number of Samples Collected
Drywall or Joint Compound	6
Fiberboard	1
Insulation (Boiler, Evaporator, Fan, Pipe, Wire)	43
Insulation Debris	7
Miscellaneous	6
Pipe Joint	5
Plaster	9
Roofing Material – Silver Coating	1
Window Caulk	1

In addition, the following assumptions and items of note were observed during the ACM survey:

- When appropriate, samples were collected from areas of the building material already damaged or disturbed.
- The Power Plant building featured three main boiler/furnace systems: Steam Boiler Unit (Boiler-Furnace-Superheater-Airheater), four Heine Boilers, and a Detroit Stoker Boiler. The Heine Boiler and Steam Boiler Unit both had adjacent rooms thought to have historically held the steam turbines and generators, but are now mostly empty. Each system has several hoppers used for coal or coal ash present adjacent to the boiler doors. Ancillary units such as evaporators, blower fans, compressors, generators, surface water heaters, and deaerators are also prevalent throughout the building.
- The basement was not entered due to an excessive standing water hazard; however, portions of the basement were viewed from various locations, as available. Suspect insulation was observed in the basement as well as an insulating jacket on bottom ash hoppers for the Steam Boiler Unit.
- Based on the types of windows present, it is likely that the three boiler/furnace systems were constructed at different times to account for rising demand of power from the plant. Each boiler/furnace system was sampled as a separate homogenous area (HA).

- Suspect insulation was observed throughout the building on piping, pipe fittings, boiler/furnace units, evaporator units, blower units, and wires. Each system/unit was sampled as a separate HA.
- Six areas of pipe insulation debris were sampled as separate HAs on the various floors and catwalks of the Power Plant.
- Drywall samples included sheetrock, tape, compound, and/or texture components. The northern office area was the only place with sheetrock walls or ceilings. Plaster ceilings were present in the main turbine room and on the joints of the ceiling in the south turbine room.
- A suspect cement board was present on the wall between the Steam Boiler Unit and turbine room.
- All floors were concrete or grated steel catwalks.
- Suspect window caulking/glazing were present.
- No ceiling tiles or vinyl cove base were observed in the building.
- Fire-rated doors present are assumed to be ACM.
- Roofing was a flat surface with a silver coating.
- Miscellaneous materials sampled include an electrical panel, plaster on the Heine Boilers, brick caulking, a fire brick, and boiler door gasket.

5.1.2 Barn

A total of nine (9) bulk samples were collected from the Barn and submitted for PLM analysis. The following number of samples were collected of each bulk material.

Bulk Material	Number of Samples Collected
Insulations (hose, pipe, other)	4
Fiberboard	1
Manhole Gasket	2
Plaster	2

In addition, the following assumptions and items of note were observed during the ACM survey:

- When appropriate, samples were collected from areas of the building material already damaged or disturbed.
- Walls and the ceiling were corrugated metal and were not considered suspect materials.
- No suspect flooring was observed since the entire floor was concrete.

- No suspect window glazing was observed in the building.
- Ceiling tiles and vinyl cove base were not present in the building.
- The loft area was used for storage and had a box of suspect pipe insulation and some cement board present.
- There was a box of Johns-Manville Superex Combination Pipe Insulation observed on the east side of the barn. Additional suspect materials, such as a Flexitallic manhole gasket, plaster bags, loose insulation, and hose insulation were also observed.

5.1.3 Maintenance Shop

A total of 16 bulk samples were collected from the Maintenance Shop and submitted for PLM analysis. The following number of samples were collected of each bulk material.

Bulk Material	Number of Samples Collected
Brake Pad	1
Covering	1
Roofing Felt	1
Packing/Gaskets	9
Roofing Material - Tar	3
Window Caulk	1

In addition, the following assumptions and items of note were observed during the ACM survey:

- When appropriate, samples were collected from areas of the building material already damaged or disturbed.
- No suspect materials were observed on the walls as all walls were brick.
- No suspect flooring was observed since the entire floor was concrete.
- Suspect window caulking was observed at the Site.
- Ceiling tiles and cove base were not present in the building.
- Roofing material sampled include roofing tar on the perimeter and roofing felt paper below corrugated metal roofing.
- Suspect materials were observed in the loft area such as a one-gallon container of Asbestoline Semi-Plastic Roof Coating and Johns-Manville Fireite Asbestos Furnace Cement. These were not sampled and are assumed to contain asbestos. However, a roll of roofing felt also present was sampled.

- Additional suspect materials such as brake pads, coverings, felt, and Garlock mechanical packing/gaskets were observed in the shop.
- No insulations were observed on piping present in the building.

5.1.4 Trailer

A total of six (6) bulk samples were collected from the Trailer and submitted for PLM analysis. The following number of samples were collected of each bulk material.

Bulk Material	Number of Samples Collected
Drywall	3
Floor Tile	2
Roofing Material – Asphalt Shingles	1

In addition, the following assumptions and items of note were observed during the ACM survey:

- When appropriate, samples were collected from areas of the building material already damaged or disturbed.
- Drywall samples included sheetrock, compound, and/or texture components. Drywall was only present in the kitchen. The rest of the trailer had wooden sheeting or paneling for walls and ceilings.
- A wooden subfloor was present below all tiled and carpeted areas.
- No suspect window glazing was observed at the Site as all windows were vinyl or metal.
- Ceiling tiles, sink insulation, and cove base were not present in the building.
- Roofing was comprised of asphalt shingles.
- No suspect insulation was observed in the crawlspace or water heater closet.

5.1.5 Little House

Only one (1) bulk sample was collected from the Little House and submitted for PLM analysis as indicted in the following table.

Bulk Material	Number of Samples Collected
Linoleum	1

In addition, the following assumptions and items of note were observed during the ACM survey:

• When appropriate, samples were collected from areas of the building material already damaged or disturbed.

Acme Power Plant, Sheridan County, WY Phase II ESA Report – Hazardous Building Materials October 2017 Page 12

- Walls were comprised of wooden paneling.
- A wooden subfloor was present below the linoleum.
- Ceiling tiles and cove base were not present in the building.
- Roofing was comprised of asphalt shingles.

5.1.6 Soil Sampling

A total of four (4) exterior surface soil samples were collected at the Site and submitted for PLM analysis. The following assumptions and items of note were observed during the soil sampling:

- The first soil sample (APP-SO01-ACM) was taken adjacent to an open tote with what is assumed to be friable pipe insulation debris spilling onto the ground (Appendix A – Photograph 52).
- The remaining three soil samples (APP-SO02-ACM, APP-SO03-ACM, and APP-SO04-ACM) were collected near Power Plant doors located on the northwest, northeast, and southeast sides of the building.

5.2 LEAD-BASED PAINT

5.2.1 Power Plant

A total of 66 XRF readings were taken from the Power Plant. The following number of readings were collected from each area:

Location	Readings Count
Exterior	11
Interior	54
Roof	1

5.2.2 Barn

A total of seven (7) XRF readings were taken from the Barn. The following number of readings were collected from each area:

Location	Readings Count
Exterior	4
Interior	3

5.2.3 Maintenance Shop

A total of seven (7) XRF readings were taken from the Maintenance Shop. The following number of readings were collected from each area:

Location	Readings Count
Exterior	4
Interior	3

5.2.4 Trailer

A total of 16 XRF readings were taken from the Trailer. The following number of readings were collected from each area:

Location	Readings Count
Exterior	5
Interior	11

5.2.5 Little House

No XRF readings were collected from this building.

5.3 PCBS, MERCURY, AND MOLD

The following observations were made during the visual inspections:

- Light fixtures in the buildings primarily used fluorescent bulbs. None of the light fixtures observed in the buildings appeared to be leaking fluids. Of the ballasts inspected, none of the ballasts had "no PCB" markings. A total of six (6) potential PCB-containing ballasts were observed in the Barn and (6) potential PCB-containing ballasts were observed in the in the Maintenance Shop. Five (5) transformers were observed in the main turbine room of the Power Plant.
- One mercury thermostat switch was observed in the Trailer.
- Mold was encountered in the Barn and Power Plant buildings. Damp areas with moss growth were observed throughout the Power Plant and a moldy odor was noted in the basement.

6.0 EVALUATION AND INTERPRETATION OF INFORMATION, DATA, AND RESULTS

The evaluation and interpretation of the information, data, and results for the Phase II ESA are presented below. This section summarizes the field screening data and laboratory results obtained to identify the location and extent of contamination. Benchmarks used for comparison are listed below:

ACM

- Asbestos-Containing Materials in Schools Rule (40 Code of Federal Regulations [CFR] Part 763, Subpart E). ACM is defined as any material containing more than one percent (1%) asbestos.
- Asbestos-Contaminated Soil HW/VRP Guidance Document (WDEQ, 2014). Asbestoscontaminated soil is defined as having any detectable asbestos in soil.

LBP

 U.S. Department of Housing and Urban Development (HUD) Guidelines for the Evaluation and Control of Lead-Based Paint Hazards in Housing (2012 Edition). The HUD benchmark for lead-based paint is greater than or equal to 1.0 milligrams per centimeter square (≥1.0 mg/cm²).

The locations of samples and/or extent of hazardous building materials exceeding benchmarks are depicted on Figures 3 - 14. Field readings and laboratory results for the samples collected are summarized in Tables 1 - 5. Photographs of the field activities conducted are presented in Appendix A. Copies of the laboratory reports are presented in Appendix B. Copies of the field notes and sample collection maps are presented in Appendix C.

6.1 ASBESTOS-CONTAINING MATERIAL

6.1.1 Power Plant

Of the 79 samples submitted for laboratory analysis, 59 samples were reported as "positive" (>1% asbestos) or trace (<1% asbestos) for asbestos. Asbestos results ranged from trace to 80% total asbestos. Of the 59 samples, three (3) were reanalyzed by point count analysis. Of the three samples reanalyzed by point count analysis, one trace sample (APP-P-PL01-110) was point counted below one and is not considered to be ACM. In all, 58 samples collected from the Power Plant were confirmed ACM. The following table indicates the type, condition, and number of samples identified as ACM.

Identified ACM	Condition	Number of ACM Samples
Boiler Insulation	Friable	3

Identified ACM	Condition	Number of ACM Samples
Brick Caulk	Non-friable	1
Brick Plaster	Friable	1
Door Insulation	Non-friable	1
Electrical Panel	Non-friable	1
Equipment Jackets	Friable	17
Fiberboard	Non-friable	1
Fire Brick	Friable	1
Insulation Debris	Friable	7
Pipe Insulation	Friable	15
Pipe Joints	Friable	5
Plaster ¹	Friable	3
Roofing Material – Silver Coating	Non-friable	1
Wire Insulation	Non-friable	1

Notes:

 1 = Insulation debris attached to the plaster was found to be ACM

ACM sample collection locations and approximate extents for the Power Plant are presented on Figures 4 - 9. The confirmed ACM sample IDs, the asbestos-containing layer(s), and the estimated volume of ACM material is presented in Table 1. Sample(s) point counted below one and not considered to be ACM is presented in Table 2. A list of the samples collected that were reported as non-detect for asbestos are presented in Table 3.

Interpretation of Results

All roofing material, pipe insulation debris, fire bricks, linear pipe insulation, pipe fittings, and equipment jackets (e.g., boiler, evaporator, blower fan, deaerator, and surface water heater) were confirmed to be ACM. Additional components of the boilers such as Detroit Stoker insulation, Heine Boiler caulking and plaster, and door gaskets on the Steam Boiler Unit were confirmed to be ACM. A cement fiberboard between the Steam Boiler Unit and the turbine room was confirmed to be ACM. Only the wire insulation coming from an induction motor for the blower on the 5th level was confirmed to be ACM. The following materials were assumed to be ACM: fire doors, furnace bricks and cement, and pipe flange gaskets.

Based on the laboratory results reported for the 58 confirmed ACM samples, asbestos is present in the Power Plant. ACM is considered to be a contaminant of concern (COC) in relation to the Site. The following table indicates the location and estimated extent of ACM identified in the Power Plant.

ACM Material	Location	Estimated Extent
Boiler Insulation	Detroit Stoker	150 sq. ft.
Brick Caulk	Heine Boiler	50 LF
Brick Plaster	Heine Boiler	1,000 sq. ft.
Door Insulation	Steam Boiler Unit	5 sq. ft.
Electrical Panel	South Turbine Room	1 panel
Equipment Jackets	Throughout Building	4,330 sq. ft.
Fiberboard	South Rooms	1,500 sq. ft.
Fire Brick	2 nd Level Catwalk	10 sq. ft.
Fire Doors	South Rooms	3 Doors
Furnace Bricks and Cement	Boilers	6,000 sq. ft.
Insulation Debris	Throughout Building	1,380 cu. ft.
Pipe Flange Gaskets	Throughout Building	200 Gaskets
Pipe Insulation	Throughout Building	1,420 LF
Pipe Joints	Throughout Building	356 Joints
Plaster ¹	Main Turbine Rooms	5,850 sq. ft.
Roofing Material – Silver Coating	Roof	13,500 sq. ft.
Wire Insulation	5 th Level Catwalk	50 LF

Notes:

 1 = Insulation debris attached to the plaster was found to be ACM

cu. ft. = cubic feet

LF = linear feet

sq. ft. = square feet

6.1.2 Barn

Of the nine (9) samples submitted for laboratory analysis, five (5) samples were reported as "positive" (>1% asbestos) for asbestos. Asbestos results ranged from 13% to 80% total asbestos. The following table indicates the type, condition, and number of samples identified as ACM.

Identified ACM	Condition	Number of ACM Samples
Fiberboard	Non-friable	1
Manhole Gasket	Non-friable	2
Pipe Insulation	Friable	2

ACM sample collection locations and approximate extent of ACM are presented in Figure 10. The confirmed ACM sample IDs, the asbestos-containing layer(s), and the estimated extent of ACM

0003/1609-07

material is presented in Table 1. A list of the samples collected that were reported as non-detect for asbestos are presented in Table 3.

Interpretation of Results

Remnants of fiberboard in the loft area were confirmed to be ACM. One box of Johns-Manville Superex Combination Pipe Insulation and a box of loose pipe insulation were confirmed to be ACM. Additionally, Flexitallic manhole gaskets were confirmed to be ACM. These materials confirmed to be ACM are assumed to also be used in the Power Plant itself since the Barn was used as storage.

Based on the laboratory results reported for the five confirmed ACM samples, asbestos is present in the building at the Site. ACM is considered to be a COC in relation to the Site. The following table indicates the location and estimated extent of ACM identified at the Site.

ACM Material	Location	Estimated Extent
Fiberboard	Loft	80 sq. ft.
Manhole Gasket	Main Level	14 rolls
Pipe Insulation	Main Level and Loft	2 boxes

Notes:

sq. ft. = square feet

6.1.3 Maintenance Shop

Of the 16 samples submitted for laboratory analysis, 11 samples were reported as "positive" (>1% asbestos) for asbestos. Asbestos results ranged from 12% to 75% total asbestos. The following table indicates the type, condition, and number of samples identified as ACM.

Identified ACM	Condition	Number of ACM Samples
Brake Pad	Non-friable	1
Covering	Non-friable	1
Packing/Gasket	Non-friable	8
Roofing Material - Tar	Non-friable	1

ACM sample collection locations and approximate extent of ACM are presented in Figures 11 and 12. The confirmed ACM sample IDs, the asbestos-containing layer(s), and the estimated extent of ACM material is presented in Table 1. A list of the samples collected that were reported as non-detect for asbestos are presented in Table 3.

Interpretation of Results

Roofing tar on the perimeter of the roof was confirmed to be ACM. Several products such as Garlock packing/gaskets, brake pads, and pipe coverings were confirmed to be ACM. Asbestoline

Semi-Plastic Roof Coating and Johns-Manville Fireite Asbestos Furnace Cement observed in the loft area were assumed to be ACM. These products were assumed to have been used in the power plant itself and may be present in the machinery and/or furnaces.

Based on the laboratory results reported for the 11 confirmed ACM samples, asbestos is present in the building at the Site. ACM is considered to be a COC in relation to the Site. The following table indicates the location and estimated extent of ACM identified at the Maintenance Shop.

ACM Material	Location	Estimated Extent
Asbestoline and Fireite	Loft	2 gallons
Brake Pad	Main Level	3 pads
Covering	Main Level	5 LF
Packing/Gasket	Main Level	8 rolls and 3 gaskets
Roofing Material	Roof	110 LF

Notes:

LF = linear feet

6.1.4 Trailer

Of the six (6) samples submitted for laboratory analysis, none of the samples were reported as "positive" (>1% asbestos) or trace (<1% asbestos) for asbestos. A list of the samples collected that were reported as non-detect for asbestos is presented in Table 3.

Interpretation of Results

Based on the laboratory results reported for the bulk samples, asbestos is not present in the Trailer at the Site. ACM is not considered to be a COC for the building in relation to the Site.

6.1.5 Little House

The one (1) sample submitted for laboratory analysis from the Little House was reported as "positive" (>1% asbestos) for asbestos at 25%. The following table indicates the type, condition, and number of samples identified as ACM.

Identified ACM	Condition	Number of ACM Samples
Linoleum	Friable	1

The sample location and approximate extent of ACM are presented in Figure 14. The confirmed ACM sample, the asbestos-containing layer, and the estimated extent of ACM material is presented in Table 1.

Interpretation of Results

The orange linoleum was confirmed to be ACM. Based on the laboratory result reported for the confirmed ACM sample, asbestos is present in the Little House. ACM is considered to be a COC in relation to the Site. The following table indicates the location and estimated extent of ACM identified in the Little House.

ACM Material	Location	Estimated Extent
Linoleum	Main Level	80 sq. ft.
Notes:		

sq. ft. = square feet

6.1.6 Soil Sampling

Of the four samples submitted for laboratory analysis, all samples were reported as "trace" (<1% asbestos) for asbestos. The soil sample collection locations are presented in Figure 3. The soil sample results are presented in Table 4.

Interpretation of Results

The presence of trace amounts of asbestos in exterior surface soils located outside the door of the Power Plant indicates friable asbestos fibers are migrating beyond the walls of the Power Plant building. It is believed that fibers are migrating to exterior soils through open doors or damaged windows. The tote of friable pipe insulation debris is also releasing asbestos fibers into the air and soil.

Based on the laboratory result reported for the soil samples, asbestos sourced from inside the Power Plant and debris at the Site is present in the exterior soils. Asbestos is considered to be a COC in relation to the Site. The following table indicates the location and type of asbestos identified at the Site.

Sample ID	Asbestos Type (% Composition)	Location
APP-SO01-ACM	Chrysotile Trace	Southwest by insulation debris tote
APP-SO02-ACM	Chrysotile Trace	Northwest door
APP-SO03-ACM	Chrysotile Trace	Southeast door
APP-SO04-ACM	Chrysotile Trace	Northeast door

6.2 LEAD-BASED PAINT

6.2.1 Power Plant

Of the 66 XRF readings taken from the building, a total of 20 readings were positive for LBP contamination ($\geq 1 \text{ mg/cm}^2$). The following table indicates the location, current surface paint color, and percent lead for LBP identified in the Power Plant.

Location (# of Positive Readings)	Current Surface Paint Color	% LBP (± Error)
Exterior		
Door (3)	Green	2.3 mg/cm ² (± 0.21) to 4.99 mg/cm ² (± 0.42)
Door Frame (1)	Green	$1.19 \text{ mg/cm}^2 (\pm 0.08)$
Window Sash (1)	Green	$3.37 \text{ mg/cm}^2 (\pm 0.28)$
Interior		
	Brown	$2.28 \text{ mg/cm}^2 (\pm 0.24)$
Door (6)	Dark Brown	$\frac{1.11 \text{ mg/cm}^2 (\pm 0.06) \text{ to } 3.67}{\text{mg/cm}^2 (\pm 0.5)}$
	Green	$2.88 \text{ mg/cm}^2 (\pm 0.26)$
	White	$5 \text{ mg/cm}^2 (\pm 0.45)$
	Cream	$1 \text{ mg/cm}^2 (\pm 0.04)$
Wall (7)	Dark Brown	1 mg/cm ² (± 0.06 to 0.09) to 1.13 mg/cm ² (± 0.06)
	White	$1 \text{ mg/cm}^2 (\pm 0.04 \text{ to } 0.08)$
Window Frame (2)	White	$\frac{3.81 \text{ mg/cm}^2 (\pm 0.62) \text{ to } 3.82}{\text{mg/cm}^2 (\pm 0.36)}$

A complete list of LBP readings is presented in Table 5. The location and approximate extent of LBP identified in the Power Plant is presented on Figures 5 and 7.

Interpretation of Results

Based on the XRF results, elevated lead concentrations are present on the door components, window components, and walls on the interior and exterior of the Power Plant. The following table lists the location, current surface paint color, and estimated extent of LBP identified. Although there were positive readings on the exterior, no bare soils were present around the location of the readings; therefore, lead impacts to surface soil were not evaluated. LBP is considered to be a COC at the Site.

Location	Current Surface Paint Color	Estimated Extent
Exterior		
Door	Green	170 sq. ft.
Door Frame	Green	100 LF
Window Sash	Green	2,350 LF

Location	Current Surface Paint Color	Estimated Extent
Interior		
	Brown	50 sq. ft.
Deer	Dark Brown	100 sq. ft.
Door	Green	25 sq. ft.
	White	25 sq. ft.
	Cream	1,200 sq. ft.
Wall	Dark Brown	650 sq. ft.
	White	3,000 sq. ft.
Window Frame	White	1,000 LF

Notes: LF = linear feet sq. ft. = square feet

6.2.2 Barn

Of the seven (7) XRF readings taken from the building, five (5) readings were positive for LBP contamination ($\geq 1 \text{ mg/cm}^2$). The following table indicates the location, current surface paint color, and percent lead for LBP identified at the Barn.

Location (# of Positive Readings)	Current Surface Paint Color	% LBP (± Error)
Exterior		
Door (3)	Green	$1.03 \text{ mg/cm}^2 (\pm 0.04)$
Door Jamb (1)	Green	2.05 mg/cm ² (\pm 0.19) to 4.59 mg/cm ² (\pm 0.38)
Interior		
Door (1)	Green	$4.96 \text{ mg/cm}^2 (\pm 0.45)$

A complete list of LBP readings is presented in Table 5. The location and approximate extent of LBP identified in the Barn is presented on Figure 10.

Interpretation of Results

Based on the XRF results, elevated lead concentrations are present on the door components on the interior and exterior of the Barn. The following table lists the location, current surface paint color, and estimated extent LBP present at the Site. Although there were positive readings on the exterior, no bare soils were present around the location of the readings; therefore, lead impacts to surface soil were not evaluated. LBP is considered to be a COC at the Site.

Current Surface Paint Color	Estimated Extent		
Exterior			
Green	150 sq. ft.		
Green	30 LF		
Interior			
Green	230 sq. ft.		
	Current Surface Paint Color Green Green		

Notes:

LF = linear feet

sq. ft. = square feet

6.2.3 Maintenance Shop

Of the seven (7) XRF readings taken from the building, a total of five (5) readings were positive for LBP contamination ($\geq 1 \text{ mg/cm}^2$). The following table indicates the location, current surface paint color, and percent lead for LBP identified at the Maintenance Shop.

Location (# of Positive Readings)	Current Surface Paint Color	% LBP (± Error)
Exterior		
Door (2)	Green	2.52 mg/cm ² (± 0.23) to 2.58 mg/cm ² (± 0.22)
Trim (1)	Green	$3.52 \text{ mg/cm}^2 (\pm 0.3)$
Window Sash (1)	Green	$1.76 \text{ mg/cm}^2 (\pm 0.16)$
Interior		
Door (1)	Green	$1.99 \text{ mg/cm}^2 (\pm 0.19)$

A complete list of LBP readings is presented in Table 5. The location and approximate extent of LBP identified is presented on Figure 11.

Interpretation of Results

Based on the XRF results, elevated lead concentrations are present on the doors, trim, and window sashes in the building. The following table lists the location, current surface paint color, and estimated extent LBP present. Although there were positive readings on the exterior, no bare soils were present around the location of the readings; therefore, lead impacts to surface soil were not evaluated. LBP is considered to be a COC at the Site.

Location	Current Surface Paint Color	Estimated Extent
Exterior		
Door	Green	150 sq. ft.

0003/1609-07

Location	Current Surface Paint Color	Estimated Extent
Trim	Green	60 LF
Window Sash	Green	720 LF
Interior		
Door	Green	230 sq. ft.
Matan		

Notes: LF = linear feet sq. ft. = square feet

6.2.4 Trailer

Of the 16 XRF readings taken from the building, only one (1) reading was positive for LBP contamination ($\geq 1 \text{ mg/cm}^2$). The following table indicates the location, current surface paint color, and percent lead for LBP identified at the Trailer.

Location (# of Positive Readings)	Current Surface Paint Color	% LBP (± Error)
Exterior		
Wall (1)	Dark Brown	$1 \text{ mg/cm}^2 (\pm 0.03)$

A complete list of LBP readings is presented in Table 5. The location and approximate extent of LBP identified at the Trailer is presented on Figure 13.

Interpretation of Results

Based on the XRF results, elevated lead concentrations are present on an exterior wall of the trailer. The following table lists the location, current surface paint color, and estimated extent of LBP present at the Site. Although there was a positive reading on the exterior, no bare soils were present around the location of the reading; therefore, lead impacts to surface soil were not evaluated. LBP is considered to be a COC at the Site.

Location	Current Surface Paint Color	Estimated Extent
Exterior		
Wall	Dark Brown	60 sq. ft.
Notes:	•	

sq. ft. = square feet

6.2.5 Little House

Paint on the Little House is assumed to be LBP. The location and approximate extent of LBP identified is presented on Figure 14.
Interpretation of Results

The following table lists the location, current surface paint color, and estimated extent LBP present at the Little House. Lead impacts to surface soil were not evaluated. LBP is considered to be a COC at the Site.

Location	Current Surface Paint Color	Estimated Extent
Exterior		
Wall	White	150 sq. ft.

Notes:

sq. ft. = square feet

6.3 PCBS, MERCURY, AND MOLD

The following additional items were noted:

- Of the light ballasts observed, potential PCB-containing ballasts were only identified in the Barn and Maintenance Shop. None of the light fixtures observed in the buildings appeared to be leaking fluids. Additionally, five transformers were confirmed to have PCBs present and are likely leaking, as indicated in sediment sample results (WESTON, 2017c).
- One mercury thermostat switch was observed in the trailer at the Site.
- Mold was encountered at the Site.

Interpretation of Results

- Based on the visual inspections, PCBs are considered COCs at the Site.
- Based on the visual inspections, mercury is considered a COC at the Site.
- Based on the visual inspections, mold is considered a COC at the Site.

6.4 CONCEPTUAL SITE MODEL

Per ASTM E1903-11 (Section 6.4.6), validation of the conceptual site model is conducted by evaluating testing results and other investigation findings to determine whether available information is sufficient to support sound conclusions regarding the presence of the target analytes. The presence of the target analytes investigated as part of this Phase II ESA along with the current exposure pathways, as applicable, for the Site is presented in the following table.

Target		Contaminants Present Above	Exposure	Exposure	Human Receptors		
Analytes	Media	Screening Benchmarks	Pathway	Route	Residential	Workers	Visitors/ Trespassers
	Building	ilding terials Yes I Soil	D ((11	Dermal		Х	Х
ACM Mate and	Materials		Complete	Ingestion		Х	Х
	and Soil			Inhalation		Х	Х
	D '11'	Building Matariala Yes	Potentially Complete	Dermal		Х	Х
LBP	Building			Ingestion		Х	Х
	Iviaterials			Inhalation		Х	Х
Mercury,	D '11'		D (11	Dermal		Х	Х
PCBs, and Mold	Building	ng Ils Yes	Potentially Complete	Ingestion		Х	Х
	materials			Inhalation		X	X
Notes: $ = F$	Recentor not a	t risk for exposure ()	Rased on prese	nt site use/rede	evelopment plans)	

lotes: -- = Receptor not at risk for exposure (Based on present site use/redevelopment plans)

X = Receptor at risk to exposure (Currently or potentially based on current site use/redevelopment plans)

<u>CSM Explanation</u>: As no definite redevelopment plans exist, evaluation of exposure pathway completeness is based upon the current site use (abandoned – with potential visitors/trespassers) and workers accessing the Site during future assessment, remediation, and/or Site redevelopment. Short-term visitors to the Site may include visitors for site walks, general contractors, or trespassers. Once future site-specific activities are determined or if a change in current use occurs, exposure pathways should be re-assessed as they may alter the pathway completeness presented in this report and require further evaluation prior to conducting any activities or change in use at the Site.

6.5 DISCLOSURE OF AVAILABLE DATA INSUFFICIENT TO MEET OBJECTIVES

Per ASTM E1903-11 (Section 1.3.2), all Phase II ESA reports must disclose any respect in which available data are insufficient to meet the objectives of the assessment. Listed below are the disclosures in which the available data set for this investigation were insufficient to meet the objectives of this Phase II ESA, if any.

 Although one asbestos sample (APP-P-EJO3-078) was not received by the lab, two other samples were taken from the same evaporator jacket and were confirmed to be ACM. Loss of this sample did not affect the quality of the data.

Based upon the objectives for this Phase II ESA, all objectives were met based upon the available data. In no respect was the available data insufficient to meet the objectives.

7.0 CONCLUSIONS OF THE PHASE II ESA

START performed a Phase II ESA in conformance with the scope and limitations of ASTM Practice E1903-11 for Acme Power Plant at 165 Acme Road located in Sheridan, Wyoming. The following list is a summary of the conclusions regarding COCs and associated media identified by START at the Site:

Asbestos-Containing Material

 Based on the results of the ACM survey, asbestos is present throughout the Power Plant as well as in the Barn, Shop, and Little House. The presence of trace amounts of asbestos in exterior surface soils located outside the door of the Power Plant indicates friable asbestos fibers are migrating beyond the walls of the Power Plant building. ACM is considered to be a COC in relation to the Site.

Lead-Based Paint

 Based on the XRF results, elevated lead concentrations are present on door components, window components, walls, and/or trim in all five buildings at the Site. Although there were positive readings on building exterior surfaces, no bare soils were present around the locations of the readings. Therefore, lead impacts to surface soil were not evaluated. LBP is considered to be a COC at the Site.

PCBs, Mercury, and Mold

A summary of the observations regarding the visual inspections conducted are presented below:

- Of the light ballasts observed, potential PCB-containing ballasts were only identified in the Barn and Maintenance Shop. None of the light fixtures observed in the building appeared to be leaking fluids. Additionally, five transformers were confirmed to have PCBs present and are likely leaking, as indicated in sediment sample results (WESTON, 2017c). PCBs are considered COCs in relation to the Site.
- One mercury thermostat switch was observed in the trailer at the Site. Mercury is considered a COC in relation to the Site.
- Mold was encountered at the Site. Mold is considered a COC in relation to the Site.

RECOMMENDATIONS

Based on the results of the environmental assessment, START recommends the following:

 START recommends consulting with the Wyoming Department of Environmental Quality (WDEQ) Air Quality Division (AQD) Asbestos Program regarding the path forward for cleanup of ACM at the Site. Due to the extensive amount of asbestos identified, the remedial option selected for ACM will likely be the primary driver for remediation of all hazardous building materials identified at the Site. Possible remediation options for discussion may include constructing an asbestos landfill on-site or abatement and off-site disposal. Regardless, START recommends contracting an accredited asbestos remediation company to help determine and/or implement appropriate remedial actions to address the ACM at the Site during the cleanup phase of redevelopment. Any work conducted should be performed by companies certified to handle ACM materials.

- Remove and properly dispose of the tote of friable pipe insulation debris located on the southwest portion of the property next to the railroad tracks. Additional assessment of exterior surface soils using an Incremental Sampling Methodology will be needed to delineate the extent and depth of the asbestos impacts. Activity based sampling is recommended for exposure assessments (WDEQ, 2014).
- START recommends contracting an accredited lead remediation company to determine appropriate remedial actions and/or disposal requirements to address the LBP at the Site during the cleanup phase of redevelopment (e.g., encapsulation, chemical striping, removal, etc.). Additional paint chip samples may be collected to confirm LBP. Dust control methods should be implemented for the debris and it is recommended that all work be performed by an EPA Lead-Safe certified firm. Toxicity Characteristic Leaching Procedure (TCLP) samples will be required for on-site or off-site disposal as per the WDEQ Solid and Hazardous Waste Division requirements (WDEQ, 2015).
- PCB-containing equipment identified or encountered should be properly removed and disposed prior to renovation or demolition activities. Additional sampling of equipment and concrete in the basement of the Power Plant, especially below the transformers, may be necessary prior to on-site or off-site disposal in order to comply with the Toxic Substance Control Act.
- All mercury-containing thermostat switches identified or encountered should be properly removed and disposed prior to renovation or demolition activities.
- Mold should be controlled during demolition (e.g., dust control, ventilation, etc.) or remediated by a certified restoration company, as necessary pending the remediation options selected for the Site.
- As a safety precaution, do not enter the Power Plant or Barn without developing a sitespecific health and safety plan. Affix warning signs as described in 29 CFR 1910.1001 to all entrances of buildings with asbestos present.

8.0 SIGNATURE OF PHASE II ASSESSOR AND SEAL

This Phase II ESA was completed by the following START personnel and subcontractor(s), if applicable. Qualifications are provided at the end of the report:

- Mr. Greg Geras, P.G. Project Manager;
- Mr. Michael Cherny Project Team Leader; and
- Mr. Joe Rudi Project Scientist.

Mr. Greg Geras, P.G. has undertaken the role of Phase II Assessor for this assessment. The following is the certification statement as defined in ASTM Practice E1903-11 (Section 9.2.1):

We have performed a Phase II environmental site assessment at the Acme Power Plant at 165 Acme Road located in Sheridan, WY in conformance with the scope and limitations of ASTM Practice E1903-11 and for the following objectives:

- Assess and evaluate suspected contaminants that may be present at the Site. Develop sufficient information to reasonably render a professional opinion that, with respect to the potential concerns assessed, hazardous substances either are or are not present at the property, including the concentrations of the substances if present;
- Gather and provide sufficient data to assist the TBA recipient to make informed decisions with regard to the future use of the property; and
- Gather sufficient data to provide cost estimates for properly disposing hazardous materials, if necessary.

9.0 SPECIFICATIONS FOR ASTM E1903-11 REPORT USE AND RELIANCE

9.1 SPECIAL TERMS AND CONDITIONS

This document has been prepared by the WESTON START-IV team as tasked by the EPA solely for the use and benefit of the EPA and Sheridan County Conservation District (SCCD). Any use of this document or information herein by persons or entities other than the EPA or SCCD, without the express written consent of START, will be at the sole risk and liability of said person or entity. START will not be liable to the EPA, SCCD, or such persons or entities, for any damages resulting therefrom. It is understood that this document may not include all information pertaining to the described site.

9.2 LIMITATIONS AND EXCEPTIONS OF ASSESSMENT

ASTM E1903-11 (Section 4.2.1) acknowledges that "No Phase II ESA can eliminate all uncertainty. Furthermore, any sample, either surface or subsurface, taken for chemical testing may or may not be representative of a larger population. Professional judgment and interpretation are inherent in the process, and even when exercised in accordance with objective scientific principles, uncertainty is inevitable. Additional assessment beyond that which was reasonably undertaken may reduce the uncertainty". ASTM E1903-11 (Section 4.2.1.2) acknowledges that "The effectiveness of a Phase II ESA may be compromised by limitations or defects in the information used to define the objectives and scope of the investigation, including inability to obtain information concerning historic site uses or prior site assessment activities despite the efforts of the user and Phase II Assessor to obtain such information in accordance with 5.1.3". Furthermore, the ASTM E1903-11 (Section 4.2.2) states "Phase II ESAs do not generally require an exhaustive assessment of environmental conditions on a property. There is a point at which the cost of information obtained and the time required to obtain it outweigh the benefit of the information and, in the context of private transactions and contractual responsibilities, may become a material detriment to the orderly conduct of business. If the presence of target analytes is confirmed on a property, the extent of further assessment is a function of the degree of confidence required and the degree of uncertainty acceptable in relation to the objectives of the assessment".

9.3 DISCLAIMERS

START has performed this Phase II ESA in general conformance with the scope and limitations of ASTM E1903-11 standards and TDD 0003/1609-07. The Phase II ESA findings and conclusions presented herein are professional opinions based solely on data collected during the assessment and/or interpretation of information and past data provided for review. The information and data collected from the Site by START is based on the conditions existing on the date(s) of START's assessment activities at the property. START does not warrant or guarantee information obtained from third parties used for this assessment are correct, complete, and/or current.

Though START did collect samples and/or perform testing during this assessment, it is possible that past contamination remains undiscovered or that property conditions will change in the future. START does not warrant or guarantee the property suitable for any particular purpose or certify the property as "clean."

ASTM E1903-11 (Section 1.5) states "This practice is not intended to supersede applicable requirements imposed by regulatory authorities. This practice does not attempt to define a legal standard of care either for the performance of professional services with respect to matters within its scope, or for the performance of any individual *Phase II Environmental Site Assessment*".

Information, limitations, and disclaimers provided in this general section apply to all of the sections included in this report.

11.0 QUALIFICATIONS

START utilized qualified, professional staff, trained in performing the scope of work required for this Phase II ESA. The START team personnel included a project manager and technical specialist(s). Their roles are described in more detail as follows:

- <u>Project Manager</u> Mr. Greg Geras, P.G. is a professional geologist with over 14 years of experience in the field of environmental sciences. Mr. Geras specializes in the development and implementation of site investigation plans, collection & analysis of soil, sediment, groundwater, and surface water data, evaluation of remediation options, and conducting Phase I and Phase II ESA investigations. He is experienced in projects involving initial and secondary site assessments, remedial action/corrective action, risk assessment, closure plan development, and agency negotiation.
- <u>Project Scientist</u> Mr. Joe. Rudi, has a B.A. in Outdoor Studies with 7+ years of experience in the field of environmental sciences including environmental lab work, Phase I/II ESAs, MMRP investigations, Phase I site investigations, removal actions and environmental remediation; Mr. Rudi has managed/conducted quality control on projects from \$10,000 to 800,000 dollars for the United States Air Force, United States Army Corp of Engineers, and the EPA.
- <u>Scientist</u> Mr. Michael Cherny has 2+ years of project experience collecting soil, groundwater, surface water, and air samples, and conducting air monitoring. His experience includes conducting site assessments, removals, technical report documentation, and field instrument proficiency. Mr. Cherny is a certified asbestos and LBP inspector in Colorado, Montana, and EPA administered states.

APPENDIX B LABORATORY REPORTS

June 14, 2017

Subcontract Number: Laboratory Report: Project # / P.O. # Project Description: NA RES 381215-1 20408.016.003.0411.00 Acme Power Plant

Greg Geras Weston Solutions, Inc. (CO) 1435 Garrison St. Ste. 100 Lakewood CO 80215

Dear Customer,

Reservoirs Environmental, Inc. is an analytical laboratory accredited for the analysis of Industrial Hygiene and Environmental matrices by the National Voluntary Laboratory Accreditation Program (NVLAP), Lab Code 101896-0 for Transmission Electron Microscopy (TEM) and Polarized Light Microscopy (PLM) analysis and the American Industrial Hygiene Association (AIHA), Lab ID 101533 - Accreditation Certificate #480 for Phase Contrast Microscopy (PCM) analysis. This laboratory is currently proficient in both Proficiency Testing and PAT programs respectively.

Reservoirs Environmental, Inc. has analyzed the following samples for asbestos content as per your request. The analysis has been completed in general accordance with the appropriate methodology as stated in the attached analysis table. The results have been submitted to your office.

RES 381215-1 is the job number assigned to this study. This report is considered highly confidential and the sole property of the customer. Reservoirs Environmental, Inc. will not discuss any part of this study with personnel other than those of the client. The results described in this report only apply to the samples analyzed. This report must not be used to claim endorsement of products or analytical results by NVLAP or any agency of the U.S. Government. This report shall not be reproduced except in full, without written approval from Reservoirs Environmental, Inc. Samples will be disposed of after sixty days unless longer storage is requested. If you have any questions about this report, please feel free to call 303-964-1986.

Sincerely,

Jeanne Spencer President
